

3R Model -- Human Capital

Weekly Digest - 26.06.2026 - June 22-28, 2026

This week's article pool yields very few items directly relevant to the 3R framework, limiting the depth of analysis. The global context points to intensifying competition for skilled labor, particularly in tech and healthcare, driven by AI-related disruption and reskilling imperatives. Ukraine-specific signals include war-driven medical innovation creating unique human capital that risks being lost without systematic retention strategies. The overall picture reinforces that the global talent race is accelerating, making proactive Return and Retain policies increasingly urgent for Ukraine.

Key insight this week: This week offers very few direct 3R signals for Ukraine, but the global context paints an alarming picture: Ukraine is generating unique human capital in medicine and IT under wartime conditions, yet without systematic Retain policy and competency institutionalization, these assets will be lost to emigration or devalued by technological shifts precisely when they are most needed for post-war reconstruction.

RETURN -- Restoring Connection

> Uzbekistan pursues formal labor migration pathways to the USA

Uzbekistan is formalizing bilateral training and employment agreements with the US, converting irregular migration into structured labor export channels. This reflects a broader trend of diaspora-origin countries institutionalizing engagement with nationals abroad.

Relevance for 3R: Uzbekistan's model of formalizing migration corridors through bilateral agreements is a relevant benchmark for Ukraine, which has a much larger and more highly skilled diaspora in EU countries and the US. Ukraine could adapt this approach to create knowledge-circulation and return mechanisms.

RETAIN -- Environment for Accumulation

> Medical innovation under the Russo-Ukrainian War as unique human capital

The War on the Rocks article documents how the full-scale invasion forced Ukrainian clinicians and commanders to develop advanced battlefield medical care techniques, creating world-class clinical expertise. This knowledge is valuable not only for the current conflict but for post-conflict healthcare reconstruction.

Relevance for 3R: For the 3R model, this is a critical Retain signal: Ukraine is generating unique medical human capital that must be systematically documented, institutionalized, and kept in-country. Without deliberate policy, these specialists risk emigrating post-conflict and this knowledge risks being dispersed.

> Rethinking fertility: 2.1 births per woman does not solve human capital challenges

The article argues that the standard replacement fertility rate of 2.1 is overly simplistic and fails to capture the qualitative human capital parameters needed for national resilience. Demographic reconstruction requires both quantitative and qualitative approaches.

Relevance for 3R: For Ukraine, facing catastrophic demographic losses due to war, emigration, and deaths, this argument is especially pertinent. Retain policy must focus not only on population numbers but on preserving carriers of critical competencies.

GLOBAL CONTEXT

> India: reskilling will define IT workforce outcomes in the AI era

The report documents rapid transformation of India's IT labor market driven by generative AI and automation, with a critical gap between demand for AI skills and their supply. Organizations not investing in reskilling risk losing competitiveness.

Relevance for 3R: This global trend is a direct warning for Ukraine: the IT sector, a key employer of skilled workers and source of foreign exchange, requires systematic state support for reskilling, otherwise Ukrainian IT professionals will lose ground in global competition.

> Switzerland rejects population cap of 10 million

Swiss voters rejected an initiative to cap the country population at 10 million, preserving an open migration model. The result reflects pragmatic recognition of immigration role in sustaining the economy and labor market.

Relevance for 3R: Switzerland is one of the key host countries for Ukrainian refugees. Maintaining an open migration model means return pressure on Ukrainians in Switzerland will remain moderate, while conditions for long-term integration persist, complicating Return strategy implementation.

> AI and employment: Anthropic data points to large-scale structural labor market shifts

Anthropic co-founder Jack Clark discusses data on AI impact on employment, acknowledging the potential of recursive self-improvement and implications for global economic structure. AI may radically redistribute demand across different types of labor.

Relevance for 3R: For Ukraine, where a significant share of skilled emigrants work in IT and adjacent sectors, AI-driven structural labor market transformation may both open new niches for specialist return and devalue existing competencies, requiring revision of Recruit and Retain priorities.
