

Educational resilience is not a standalone crisis policy but a systemic prerequisite for the entire 3R model: without it, neither Return with genuine knowledge transfer, nor competency-targeted Recruit, nor demand-coupled Retain reskilling are achievable. Ukraine must treat wartime educational system resilience as a direct investment in future human capital circulation.

Educational resilience is not a standalone crisis policy but a systemic prerequisite for the entire 3R model: without it, neither Return with genuine knowledge transfer, nor competency-targeted Recruit, nor demand-coupled Retain reskilling are achievable. Ukraine must treat wartime educational system resilience as a direct investment in future human capital circulation.

Learning under crisis: how Eastern Europe, Caucasus and Central Asia countries build educational system resilience

The CEDOS study under the Global Partnership for Education framework analyzes how armed conflicts, natural disasters, and public health crises disrupt education in countries across the region. The core finding is that crises do not generate structural problems in education systems — they expose and deepen pre-existing ones. This means educational resilience is not a crisis-response measure but a baseline condition for human capital to function. For Ukraine, in a state of prolonged armed conflict, this analysis has direct practical relevance: systems that cannot withstand crises produce devalued competencies and intensify brain waste.

3R: Signal of human capital accumulation conditions (Retain): educational resilience as a systemic prerequisite for reskilling and competency application to be viable at all. Without a resilient education base, any reskilling programs reproduce brain waste at a higher level — precisely the effect the 3R Model identifies as the central threat.
